

Aardvark Embedded Solutions

Cashless Control Unit,
product code NICURF

Product Description:

What is the Cashless Control Unit?

it is everything you need to connect your computer to a cashless payment terminal.

As you may have found out, the standard low cost cashless payment terminal expects to be used in a traditional vending machine, using a connection technology called MDB. This does not connect easily to an ordinary computer.

Aardvark Embedded's CashlessConnect solution uses our own special USB to MDB converter which is coupled with a complete software API to let you easily use one of these terminals with your computer, no matter if it is a PC, Raspberry Pi or any other Linux compatible system.

We provide you with everything you need to create your system that accepts cashless payments. We even power the terminal so that all you need is your computer and the terminal itself.

If your computer runs Windows we provide C++ and Dot Net packages, for Linux we provide a set of C++ source files, or if you prefer we provide a Java interface for either.

We have tested our solution with terminals from Nayax, OTI and Crane PI, but we confidently expect it to work with any MDB terminal - MDB is an international standard.

Why does that help me?

The AES Cashless Control Unit has a *number* of positive implications for you, the machine manufacturer and for your applications programmers and other technical staff.

- ❑ Decoupling your application from the Payment Terminal that you need to use.
- ❑ Everything that you need to connect any standard MDB Cashless Payment Terminal to your computer.
- ❑ No time spent on designing and creating the low level code need to handle the complexities of the MDB protocol.
- ❑ Just plug in the Cashless Control Unit, download the full SDK, and you can instantly run the included demonstration to accept credit from a Cashless Payment Terminal.
